NOTES:

- Surge voltage V_S : Absolute maximum voltage, non-repetitive. The duration must not exceed 1 second.
- Capacitance C: The test current is 0.1 A/F, if the calculated current is >100A, then apply 100A.

- Capacitance tolerance: Initially +10%~+30%.
- Leakage current measurement procedure: 1) Charge the capacitor to the V_R with a constant current (0.1 A/F, if the calculated current is >100A, then apply 100A). 2) Hold the voltage at V_R for 72h. 3) The current to maintain V_R after 72 h is the leakage current.
- Self-discharge rate measurement procedure: 1) Charge the capacitor to V_R with a constant current (0.1 A/F, if the calculated current >100A, then apply 100A). 2) Hold the voltage at V_R for 8h. 3) Floating for 72h. 4) Measure the voltage after 72 h.
- Max constant working current: $I_{MCC} = \sqrt{\Delta T / (ESR \cdot R_{Th})}$
- Max current: $I_{Max} = 0.5C \cdot V_R / (\Delta t + ESR \cdot C)$, discharge from V_R to $V_R/2$ in 1 second.
- Short current: $I_S = V_R / ESR$
- Stored energy: $E = 0.5C \cdot V^2 / 3600$
- Energy density: $E_d = E / M$
- Usable power density: $P_d = (0.12V_R^2 / ESR) / M$
- Matched impedance power density: $P_{dMax} = (0.25V_R^2 / ESR) / M$
- Storage temperature: Storage in discharge state
- Thermal resistance: $R_{Th} = \Delta T / P$, where $P = ESR \cdot I^2$
- Thermal capacitance: For the whole capacitor
- DC life at high temperature: Hold the capacitor charged at specified voltage and temperature. The capacitance shall be >80% of the rated value, the ESR shall be <200% of the rated value.
- DC life at RT: Hold the capacitor charged at rated voltage at room temperature RT, the capacitance shall be >80% of the rated value, the ESR shall be <200% of the rated value.
- Cycle life: Charge and discharged the capacitor in the range between V_R and $V_R/2$. 5 seconds waiting period between charge and discharge. The constant test current is 0.1 A/F (if the calculated current >100A, then apply 100A).
- Shelf life: Discharged and no load applied at RT.

- Dimensions, PCB drilling pattern and potential indication:

Standard markings:

- + Name of manufacturer, part number, serial number
- + Rated voltage and capacitance, positive terminals, warning marking
- + Stored energy in watt-hours

Mounting recommendations:

- + Mounting without applying undue mechanical stress on the terminals
- + Provide adequate spacing in between cells to secure required insulation strength
- + Provide clearance around the safety vent and do not position anything next to the safety vent that may be damaged in an event of vent rupture

- Recommended wave soldering profile for printed circuit assembly with use of lead-free alloy:

Total soldering process time from room temperature to peak temperature 265°C and cool down is 10 minutes max. The time to reach the required temperatures depends on the design of the application and on the power of the pre-heating section of the soldering machine. All temperatures are measured on the cell leads on top of the PCB. Recommended thickness for PCB = 2.4 to 3.2 mm.
